## Time Units

Source: http://conversion.org/time/
Help:
=exactly equal
حapproximately equal to
$1 \mathrm{E}+12=1 \times 10^{12}$

| Unit Name | type | symbol | definition | in s fraction | in s | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| nanoseconds |  | ns | $\equiv 10^{-9} \mathrm{~s}$ |  | 0.000000001 | billionth part or a second |
| microsecond |  | $\mu \mathrm{s}$ | $\equiv 10^{-6} \mathrm{~s}$ |  | 0.000001 | millionth part of a second |
| millisecond |  | ms | $\equiv 0.001 \mathrm{~s}$ |  | 0.001 | thousandth of second |
| second | metric | s | $\equiv 1 \mathrm{~s}$ |  | 1 | SI base unit. The second is the duration of 9192631770 periods of the radiation corresponding to the transition between the two hyperfine levels of the ground state of the cesium 133 atom at 0 K temperature. |
| kiloseconds |  | ks | $\equiv 10^{3} \mathrm{~s}$ |  | 1000 | a thousand times of a second |
| megaseconds |  | Ms | $\equiv 10^{6} \mathrm{~s}$ |  | 1000000 | one million seconds |
| gigaseconds |  | Gs | $\equiv 10^{9} \mathrm{~s}$ |  | 1000000000 | one billion seconds |
| teraseconds |  | Ts | $\equiv 10^{12} \mathrm{~s}$ |  | $1 \mathrm{E}+12$ | a trillion-seconds |
| atomic unit of time |  | au | $\equiv \mathrm{a} 0 /(\alpha \cdot \mathrm{c})$ |  | 2.41888E-17 | This is the smallest meaningful time unit under which an electron takes a circle on the first Bohr pitch divided by $2 \pi$. |
| Callippic cycle |  |  | $\begin{aligned} & \hline \equiv 76 \text { years } \\ & \text { (Julian) } \end{aligned}$ |  | 2398377600 | One callippic cycle is equal to 441 mo (hollow) $+499 \mathrm{mo}($ full $)=76 \mathrm{a}$ of $365.25 \mathrm{~d}=2.3983776$ Gs |
| century |  | c | $\begin{array}{\|l} \hline \equiv 100 \text { years } \\ \text { (Gregorian) } \\ \hline \end{array}$ |  | 3155695200 | $=365.2425 \times 100 \times 86400$ seconds |
| day |  | d | $\begin{aligned} & =24 \mathrm{~h}=1440 \\ & \min \end{aligned}$ |  | 86400 | One day (solar day) is period of time from noon to noon $=24$ hours. A solar day is the time it takes for the Earth to rotate about its axis so that the Sun appears in the same position in the sky. $24[\mathrm{~h}] \times 3600[\mathrm{~s}]=86.4[\mathrm{ks}]=$ 86400 [s] |
| day (sidereal) |  | $\begin{aligned} & \mathrm{d} \\ & \text { (sidereal) } \end{aligned}$ | $\begin{aligned} & \approx 23 \mathrm{~h}, 56 \mathrm{~min}, \\ & 4.0916 \mathrm{sec} \end{aligned}$ |  | 86164.09053083288 | A sidereal day is the time needed for the Earth to rotate once around its axis so that the distant stars appear in the same position in the sky. This is $\sim 4$ minutes shorter than the solar day. |
| decade |  | dec | $\begin{aligned} & \equiv 10 \text { years } \\ & \text { (Gregorian) } \end{aligned}$ |  | 315569520 | $=365.2425 \times 10 \times 86400$ seconds |
| fortnight |  | fn | $\equiv 2 \mathrm{wk}$ |  | 1209600 | A fortnight is a unit of time equal to 14 days (2 weeks) = fourteen nights |
| helek | Hebrew |  | $\equiv 1 / 1080 \mathrm{~h}$ | 3600/1080 | 3.333333333 | The helek (or chelek) is a unit of time used in the calculation of the Hebrew calendar. $3600 \mathrm{~s} / 1080$ |
| Hipparchic cycle |  |  | $\begin{aligned} & \equiv 4 \text { Callippic } \\ & \text { cycles - } 1 \mathrm{~d} \end{aligned}$ |  | 9593424000 | A lunar cycle noticed by Hipparchus. Eric Weisstein's World of Biography It consists of four Callipic cycles less a day, in which $(4 \times 27759-1)$ days are very nearly 3760 months, $\equiv 9.593424$ Gs |
| hour |  | h | $\equiv 60 \mathrm{~min}$ |  | 3600 | One hour is a time required for minute hand on analog clock to create a circle $=3.6 \mathrm{ks}$ |
| jiffy |  | j | $\equiv 1 / 60 \mathrm{~S}$ | 1/60 | 0.016666667 | Jiffy is an informal term for any unspecified short period of time. Common $1 / 60 \mathrm{~s}$ (alternative $1 / 100 \mathrm{~s}$ ) |

| ke | \|Chinese |  | $\left\{\begin{array}{l} \equiv 1 / 100 \mathrm{~d}=14.4 \\ \min \end{array}\right.$ | 864 | $\left\lvert\, \begin{aligned} & \text { Traditional ke is unit of time in the traditional time system in ancient China. }=14.4 \mathrm{~min}=14 \mathrm{~min}, 24 \mathrm{sec}=864 \\ & \mathrm{~s}\end{aligned}\right.$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| lustre; lustrum |  |  | $\begin{aligned} & \equiv 5 \text { years (of } 365 \\ & \text { d) } \end{aligned}$ | 157680000 | A lustre is a period of five years. Its use dates back to Ancient Rome, when a lustrum was a five-year period at the end of which a full census of the Roman population would be carried out. $=5 * 365 * 86400=157.68 \mathrm{Ms}$ |
| Metonic cycle; enneadecaeteris |  |  | $\equiv 6940$ d | 599616000 | For astronomy and calendar studies, the Metonic cycle or Enneadecaeteris is a period of very close to 19 years that is nearly a common multiple of the solar year and the synodic month. $\equiv 110 \mathrm{mo}$ (hollow) +125 mo (full) $=$ $6940 \mathrm{~d} \approx 19 \mathrm{a}=599.616 \mathrm{Ms}$ |
| millennium |  |  | $\begin{aligned} & \equiv 1000 \text { years } \\ & \text { (Gregorian) } \end{aligned}$ | 31556952000 | A thousand Gregorian years $=365.2425 \times 1000 \times 86400 \mathrm{~s}=31.556952 \mathrm{Gs}$ |
| milliday |  | md | $\equiv 1 / 1000 \mathrm{~d}$ | 86.4 | One thousandth of a day $=86400 / 1000$ |
| minute |  | min | $\equiv 60 \mathrm{~s}$ | 60 | One minute is a time equal to rotation time of sweep (or second) hand at analog clock $=60 \mathrm{~s}$ |
| moment |  |  | $\equiv 90$ s | 90 | Time unit used in the Middle Ages. 1 hour on sundial was divided into 40 parts $=$ moments. 3600/40 $=90 \mathrm{~s}$ |
| month (full) |  | mo | $\equiv 30 \mathrm{~d}$ | 2592000 | Full month $=30$ days $\times 86400 \mathrm{sec}$. |
| month (Gregorian average) |  | mo | $=30.436875 \mathrm{~d}$ | 2629746 | Average Gregorian month is calculated from average Gregorian Year divided by 12 month: 365.2425 days / 12 months $\times 86400 \mathrm{sec} \approx 2.6297 \mathrm{Ms}$ |
| month (hollow) |  | mo | $\equiv 29 \mathrm{~d}$ | 2505600 | Hollow month $=29$ days $\times 86400 \mathrm{sec}$. |
| month (synodic) |  | mo | $29.530589 \text { days }$ | 2551442.89 | Synodic month = Cycle time of moon phases (example, from fool moon to next fool moon). This period is not constant and it is longer than moon rotation around Earth (sidereal month), because moon and Earth moves together around the Sun. |
| $\begin{array}{\|l} \hline \begin{array}{l} \text { month } \\ \text { (sidereal) } \end{array} \\ \hline \end{array}$ |  |  | $\begin{aligned} & \text { च } 27.321661 \\ & \text { days } \\ & \hline \end{aligned}$ | 2360591.51 | It is the time it takes the Moon to go around Earth measured from a fixed point. Sideric month is not completely constant, an average value has been used for calculating. |
| octaeteris |  |  | $=2922 \mathrm{~d}$ | 252460800 | In astronomy, an octaeteris is the period of eight solar years after which the moon phase occurs on the same day of the year plus one or two days. $=48 \mathrm{mo}($ full $)+48 \mathrm{mo}($ hollow $)+3 \mathrm{mo}(f u l l)=8$ a of $365.25 \mathrm{~d}=2922 \mathrm{~d}=$ 252.4608 Ms |
| Planck time |  |  | $\equiv(\mathrm{G} / \mathrm{c} 5)^{1 / 2}$ | 5.39116E-44 | It is the time required for light to travel in a vacuum a distance of 1 Planck length, approximately $5.39 \times 10^{-44}$ s. |
| shake |  |  | $\equiv 10^{-8} \mathrm{~s}$ | 0.00000001 | A shake is an informal unit of time equal to 10 nanoseconds (ns), or $10^{-8}$ seconds. It has applications in nuclear physics, helping to conveniently express the timing of various events in a nuclear explosion. |
| sigma |  |  | $\equiv 10^{-6} \mathrm{~s}$ | 0.000001 | Unit of time equal to one microsecond ( $1 \mu \mathrm{~s}$ ) or $10^{-6}$ seconds. |
| Sothic cycle |  |  | $\begin{aligned} & \equiv 1461 \text { a of } 365 \\ & \mathrm{~d} \end{aligned}$ | 46074096000 | The Sothic cycle or Canicular period is a period of 1,461 Egyptian civil years of 365 days each or 1,460 Julian years ( 365.25 days each $)=1461 \times 365 \times 86400[\mathrm{~s}]=46.074096$ [Gs] |
| svedberg |  | S | $\equiv 10^{-13} \mathrm{~s}$ | 1E-13 | The svedberg is actually a measure of time; it is defined as exactly $10^{-13}$ seconds ( 100 fs ). It is often used to reflect the rate at which a molecule travels to the bottom of a test tube under the centrifugal force of a centrifuge. |
| week |  | wk | $\begin{aligned} & \equiv 7 \mathrm{~d}=168 \mathrm{~h}= \\ & 10080 \mathrm{~min} \end{aligned}$ | 604800 | Week is a period of seven consecutive days (calendar week usually starts on Sunday in North America or Monday in Europe). One week consists seven days or 168 hours. |
| year (common) |  | a, y, or yr | 365 d | 31536000 | The year commonly has 365 days (except the leap year) |
| year <br> (Gregorian) |  | a, y, or yr | $\begin{aligned} & =365.2425 \mathrm{~d} \\ & \text { average } \end{aligned}$ | 31556952 | As the common year has 365 days, the Gregorian calendar with leap years compensate the deviation from the real, astronomical year. According to this calendar, every 4th year is a leap year, except for every 100th. But every 400th is a leap year. This means that there are 97 leap years in 400 year period. So according to Gregorian's calendar, one year has $365+97 / 400$ days (average). This is not a perfect approach, but in 1000 year |

|  |  |  |  | period, the defiation is only 0.3 days compared to the astronomical year. In the year 1582 Gregorian replaced the Julian calendar. |
| :---: | :---: | :---: | :---: | :---: |
| year (Julian) | $\mathrm{a}, \mathrm{y}$, or yr | $\begin{aligned} & =365.25 \mathrm{~d} \\ & \text { average } \end{aligned}$ | 31557600 | The basic calendar year has 365 days, but in fact the Earth needs a little more time around the sun. The Julian calendar compensated this with leap year (every fourth year had 366 days). According to the formula, a Julian year has $365+1 / 4=365.25$ days. But even with this compensation, the astronomical year slip 0.78 days every 100 years into real seasons. Therefore, most countries have moved to the Gregorian calendar introduced in 1582. |
| year (leap) | a, y, or yr | $=366 \mathrm{~d}$ | 31622400 | Leap year has 366 days. The role of leap year is to compensate difference from astronomical- and common calendar year. |
| year (mean tropical) | a, y, or yr | $\tilde{\sigma}^{265.242190402 \mathrm{~d}}$ | 31556925.25 | Tropical year is the length of time it takes for the Sun to return to the same position in the cycle of seasons, approximately 365.24219 days |
| year (sidereal) | a, y, or yr | 祘 | 31558149.76 | Sidereal year is a time taken for Sun to return to the same position with respect to the stars of the celestial sphere, approximately 365.256363 days. |
| blink |  | $\approx 0.25 \mathrm{~s}$ | 0.25 | Human blink duration ranges from 0.1 to 0.4 seconds. Blink time is calculated as average of this range, and this value is a quarter of a second. |
